BASIC ELECTRICITY

SUBCOURSE MD0902

EDITION 200

DEVELOPMENT

This subcourse is approved for resident and correspondence course instruction. It reflects the current thought of the Academy of Health Sciences and conforms to printed Department of the Army doctrine as closely as currently possible. Development and progress render such doctrine continuously subject to change.

ADMINISTRATION

For comments or questions regarding enrollment, student records, or shipments, contact the Nonresident Instruction Section at DSN 471-5877, commercial (210) 221-5877, toll-free 1-800-344-2380; fax: 210-221-4012 or DSN 471-4012, e-mail accp@amedd.army.mil, or write to:

COMMANDER
AMEDDC&S
ATTN MCCS HSN
2105 11TH STREET SUITE 4192
FORT SAM HOUSTON TX 78234-5064

Approved students whose enrollments remain in good standing may apply to the Nonresident Instruction Section for subsequent courses by telephone, letter, or e-mail.

Be sure your social security number is on all correspondence sent to the Academy of Health Sciences.

CLARIFICATION OF TRAINING LITERATURE TERMINOLOGY

When used in this publication, words such as "he," "him," "his," and "men" are intended to include both the masculine and feminine genders, unless specifically stated otherwise or when obvious in context.

**CORRESPONDENCE COURSE OF
THE US ARMY MEDICAL DEPARTMENT CENTER AND SCHOOL
SUBCOURSE MDO902
BASIC ELECTRICITY**

INTRODUCTION

This subcourse is designed to give you a basic knowledge of simple circuits that carry electricity from a power source to some kind of electrical equipment. With a knowledge of these fundamentals, you will be able to make better use of electrical equipment and to better understand future textual materials that mention electrical factors in the function of equipment.

Subcourse Components:

This subcourse consists of programmed text.

Lesson 1. Basic Electrical Circuits

Study Suggestions:

Here are some suggestions that may be helpful to you in completing this subcourse:

--Read and study each lesson carefully.

--Complete the subcourse lesson.

Credit Awarded:

To receive credit hours, you must be officially enrolled and complete an examination furnished by the Nonresident Instruction Section at Fort Sam Houston, Texas. Upon successful completion of the examination for this subcourse, you will be awarded 3 credit hours.

You can enroll by going to the web site <http://atrrs.army.mil> and enrolling under "Self Development" (School Code 555).

A listing of correspondence courses and subcourses available through the Nonresident Instruction Section is found in Chapter 4 of DA Pamphlet 350-59, Army Correspondence Course Program Catalog. The DA PAM is available at the following website: <http://www.usapa.army.mil/pdffiles/p350-59.pdf>.

SUBCOURSE MD0902

LESSON 1

Basic Electricity

LESSON ASSIGNMENT

Frames 1 through 135.

LESSON OBJECTIVES

After completing this lesson, you should be able to choose the correct answers to questions about matter, current, electrical charges, conduction, potential difference, voltage, resistance, amperes, and OHM's law.

INSTRUCTIONS

This text is set up differently from most subcourses. It is a workbook that utilizes programmed instruction. The numbered "frames" present information and/or a question about presented information. You should work through the frames in the order presented. Answer each question that is presented. To check your answers, go to the shaded box of the NEXT frame. For example, the solution to the question presented in Frame 2 is found in the shaded box of Frame 3.

DISCLAIMER

The language used in this subcourse was chosen to make the lesson easier to understand and may not be as precise as definitions and terminology you will learn in the future.

FRAME 1

Purpose.

In order to understand electricity, you must know certain things about the atom and atomic physics. You will learn these fundamentals from this subcourse. (See the directions on the preceding page.)

GO TO FRAME 2.

FRAME 2

Everything you can think of is made out of matter.
People, air, and water are made out of _____

Solution to Frame 1

No question was given in Frame 1. Read and work Frame 2.

FRAME 3

If we could look “inside” a piece of matter with a very powerful microscope, we would see that matter is made up of tiny particles called _____.

Solution to Frame 2

matter

FRAME 4

All matter is made up of tiny particles called atoms. Tiny particles called _____ make up all matter.

Solution to Frame 3

atoms

FRAME 5

This drawing represents a single atom. It has two parts to it. In the center is a _____. Around the nucleus are _____.

Solution to Frame 4
atoms

FRAME 6

Some kinds of atoms have more electrons than others, but they all have two main parts. In the center is a _____. Around the nucleus are _____.

Solution to Frame 5
nucleus
electrons

FRAME 7

All electrons are said to be negatively charged.

The electrons (indicated by arrows) are _____ charged.

Solution to Frame 6
nucleus
electrons

FRAME 8

The electrons above have minus signs inside them because they are negatively charged. All electrons are said to be _____.

Solution to Frame 7
negatively

FRAME 9

Electrons

Nucleus

Protons

Inside the nucleus of atoms are positively charged particles called _____.

Solution to Frame 8
negatively charged

FRAME 10

The negatively charged particles are called _____.
The positively charged particles are called _____.

Solution to Frame 9
protons

FRAME 11

Some types of atoms (mostly in metals) have electrons that are free to move from one atom to another. These electrons are called "free electrons". The electrons moving from atom A to atom B is a _____.

Solution to Frame 10
electrons [negative]
protons [positive]

FRAME 12

Free electrons (can/cannot) leave their atom.

Solution to Frame 11

free electron

FRAME 13

An atom that gains electrons is said to be negatively charged. The atom above is gaining electrons. It will be _____ charged.

Solution to Frame 12

can

FRAME 14

A negatively charged atom always has more _____ than protons.

Solution to Frame 13
negatively

FRAME 15

An atom that loses electrons is said to be positively charged. The atom above will be _____ charged.

Solution to Frame 14
electrons

FRAME 16

A positively charged atom always has more _____ than electrons.

Solution to Frame 15
positively

FRAME 17

An atom with an equal number of electrons and protons has no charge. Which atom above has no charge, A or B? ____.

Solution to Frame 16
protons

FRAME 18

(Label here)

(Label here)

(Label here)

Under each atom, write whether it has no charge, is positively charged or is negatively charged.

Solution to Frame 17
A

FRAME 19

If the atoms that make up mater are negatively charged, then the matter is also _____.

Solution to Frame 18

No charge

Positively charged

Negatively charged

FRAME 20

To show how matter with like and unlike charges react to each other, we will use drawings of small, lightweight balls called pith balls. The drawing above shows a _____ Hanging from a string.

Solution to Frame 19

negatively charged

FRAME 21

If pit balls with unlike (positive and negative) charges are placed near each other, they (attract/repel) each other.

Solution to Frame 20

pith ball

FRAME 22

You have heard the expression that “opposites attract.” It may or may not be true with people, but it is true with electricity. As you can see, pith balls with (unlike/like) charges attract each other.

Solution to Frame 21

attract

FRAME 23

Unlike charges attract because the excess of electrons from the negatively charged object want to get to the positively charged object. They will also try to go to an object with no charge. Electrons from the negative pith ball want to go to the _____.

Solution to Frame 22

unlike

FRAME 24

The positively charge pith ball attracts the negatively charged pith ball because it lacks electrons and wants to (gain/lose) electrons.

Solution to Frame 23

positive pith ball (and also, to the pith ball with no charge)

FRAME 25

Solution to Frame 24

gain

Unlike charges attract, but, as can be seen in the drawings above, like charges (repel/attract). Note that the two pith balls with no charge neither repel nor attract each other.

FRAME 26

Solution to Frame 25

repel

Indicate whether the pith balls shown will attract, repel, or neither attract nor repel. their direction of movement.

<p>FRAME 27</p> <p>Five review questions follow Frames 28 through 32). IMPORTANT! ANSWER THESE REVIEW QUESTIONS CAREFULLY. CHECK YOUR ANSWERS.</p>	<p>Solutions to Frame 26</p> <ul style="list-style-type: none"> a. repel b. attract c. attract d. attract e. attract f. repel
<p>FRAME 28</p> <p>If an atom GAINS electrons so that it has more electrons than protons, it is then (<u>negative/positively</u>) charged.</p>	<p>Solution to Frame 27</p> <p>No question. Go on to the next step</p>
<p>FRAME 29</p> <p>If an atom loses electrons so that it has more protons than electrons, it is then (<u>negatively/positively</u>) charged.</p>	<p>Solution to Frame 28</p> <p>negatively</p>
<p>FRAME 30</p> <p>Unlike charges (<u>attract/repel</u>) each other.</p>	<p>Solution to Frame 29</p> <p>positively</p>
<p>FRAME 31</p> <p>Like charges (<u>attract/repel</u>) each other.</p>	<p>Solution to Frame 30</p> <p>attract</p>
<p>FRAME 32</p> <p>If an uncharged atom loses electrons, it becomes (<u>negatively/positively</u>) charged.</p>	<p>Solution to Frame 31</p> <p>repel</p>
<p>FRAME 33</p> <p>Now that you know something about the fundamentals of the atom, you are ready to learn about conductors, voltage, current, and resistance. By the end of this part of the lesson, you will be able to analyze an electric circuit.</p>	<p>Solutions to Frame 32</p> <p>positively</p>

FRAME 34

If you could greatly magnify a piece of material that has many free electrons, you might "see" these free electrons moving freely about.

These wandering electrons are called _____

Solution to Frame 33

No question. Go to Frame 34.

FRAME 35

A material that has many free electrons is called a conductor. Decide which material below is a conductor; and then write the word "conductor" under it.

Solutions to Frame 34

free electrons

FRAME 36

A material that has extremely few, if any, free electrons is called an insulator. Label each of the materials below as either a "conductor" or "insulator."

Solution to Frame 35

Conductor
(It has many free electrons)

FRAME 37

A material that has many free electrons is a _____.
A material that has few, if any, free electrons is an _____.

Solutions to Frame 36

FRAME 38

Silver, copper, and aluminum have many free electrons; therefore, they are all _____.

Solution to Frame 37

Conductor
Insulator

FRAME 39

Plastics, glass, and rubber have extremely few, if any, free electrons. They are all _____.

Solution to Frame 38

conductors

FRAME 40

Solution to Frame 39

insulators

Free electrons can be made to move from atom to atom through a conductor. For example, electrons are entering the conductor above at _____, moving from atom to atom, and coming out at _____.

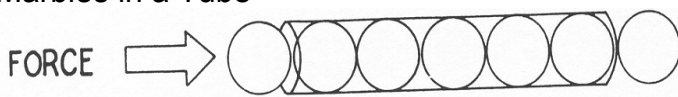

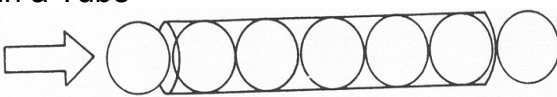

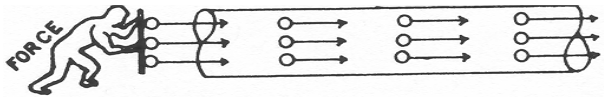

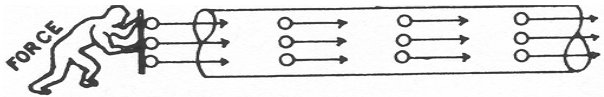

FRAME 41

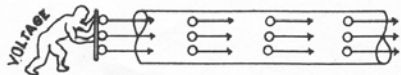

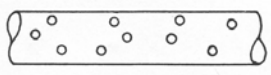

Solution to Frame 40

A
B

The movement of electrons from one atom to another through a conductor can be compared to forcing marbles through a tube. As soon as you force a marble in one end, another marble at the other end comes _____.

<p>FRAME 42</p> <p>The electrons being forced into the conductor (<u>are/are not</u>) the same as the electrons immediately coming out.</p>	<p>Solution to Frame 41</p> <p>out</p>
<p>FRAME 43</p> <p>This movement of different electrons from atom to atom through a conductor is called "current." Instead of saying that electrons are moving from atom to atom through a conductor, we can say there is a _____ in the conductor.</p>	<p>Solution to Frame 42</p> <p>are not</p>
<p>FRAME 44</p> <p>Which statement best defines current?</p> <p>a. Movement of electrons from atom to atom through a nonconductor.</p> <p>b. Movement of atoms from electron to electron through a conductor.</p> <p>c. Movement of electrons from atom to atom through a conductor.</p>	<p>Solution to Frame 43</p> <p>current</p>
<p>FRAME 45</p> <p>Marbles in a Tube</p>  <p>FORCE → </p> <p>In order to make the marbles move through the tube above, a force has to be applied.</p>  <p></p> <p>To make a current flow through a conductor, we must also apply a _____.</p>	<p>Solution to Frame 44</p> <p>c. Movement of electrons from atom to atom through a conductor.</p>

<p>FRAME 46</p> <p>“Voltage” is the electronic term for this “force” that makes current flow in a conductor. Current will flow unless we apply a force, or _____.</p>	<p>Solution to Frame 45</p> <p>Force</p>
<p>FRAME 47</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>Conductor A</p>  </div> <div style="text-align: center;"> <p>Conductor B</p>  </div> </div> <p>Current will flow in conductor A because we have applied _____ (use the electronic term). Current will not flow in conductor B because we did not apply _____.</p>	<p>Solution to Frame 46</p> <p>Voltage</p>
<p>FRAME 48</p> <p>The force that makes electrons move from atom to atom through a conductor is called _____.</p>	<p>Solution to Frame 47</p> <p>voltage</p> <p>voltage</p>
<p>FRAME 49</p> <p>Another term for voltage is "electromotive force." This is a very descriptive term for voltage because, read backward, it reads "force-motive-electro," which means the <u>force</u> that <u>moves</u> the _____.</p>	<p>Solution to Frame 48</p> <p>voltage</p>
<p>FRAME 50</p> <p>“Electromotive force” and “voltage” both refer to the force which moves electrons through a conductor. In referring to this force, you can use either the term _____ or _____.</p>	<p>Solution to Frame 49</p> <p>electrons</p>

FRAME 51

Defining voltage or electromotive force as a force that makes electrons flow through a conductor is correct; but to really know what makes current flow, we must use a more technical definition. This will require several steps.

Solution to Frame 50

electromotive force}
 voltage } either order

FRAME 52

Let us start on a more technical definition of voltage or electromotive force by talking about a battery. One of the symbols for a battery is shown below.

**Solution to Frame 51**

go on to the next step.

Draw one for practice here:

You have just drawn the symbol for a _____.

FRAME 53

One side of a battery is always negative. This means that it has more electrons than it has _____.

Solution to Frame 52

battery

FRAME 54

The negative side of the battery has a negative charge. The positive side has a _____.

Solution to Frame 53

protons

FRAME 55

As you can see from above, the negative charge can be referred to a negative _____
 The positive charge is referred to as a _____.

Solution to Frame 54

positive charge

FRAME 56

The more the electrons outnumber the protons, the (greater/smaller) the negative potential.

Solution to Frame 55

potential

positive potential

FRAME 57

The more the protons outnumber the electrons, the (greater/smaller) the positive potential.

Solution to Frame 56

greater

FRAME 58

When there is a difference in charge between two points, it is called a difference in potential. For example, the two sides of a battery have a _____.

Solutions to Frame 57

greater

FRAME 59

If we connect a conductor between the negative and positive potentials, electrons of the negative potential are greatly attracted to the _____ of the positive potential.

Solution to Frame 58

difference in potential

FRAME 60

Because of this attraction between negative and positive potentials, electrons (current) will flow from the (negative/positive) potential to the (negative/positive).

Solution to Frame 59

protons

FRAME 61

The difference in charge between the negative and positive potentials of the battery is referred to as a difference in potential. As you can see the conductor is connected across the _____ in _____.

Solution to Frame 60

[from] negative (-)

[to] positive (+)

FRAME 62

For current to flow, a conductor must be connected across a _____. Since excess electrons of the negative potential want to get to the positive potential, electrons always flow from _____ to _____.

Solution to Frame 61

difference
[in]
potential

FRAME 63

Voltage or electromotive force can be correctly thought of as “force” that makes electrons flow through a conductor; however, a more technical definition is that voltage or electromotive force is a _____ in potential.

Solution to Frame 62

difference in potential

negative (-)

positive (+)

FRAME 64

In summary then:

A technical definition of voltage (or electromotive force) is that it is a _____.

A less technical (but correct) definition of voltage is that it is the _____.

Solution to Frame 63

difference

FRAME 65

You must know enough about electricity to understand how a simple circuit works. For example, below is the circuit for the dashboard of an automobile. Label what you think is the battery, the lamp, the switch and the conductor.

Solution to Frame 64

difference in potential

force that makes electrons flow through a conductor (NOTE: Your answer need not be in the exact words. The important thing is that your answer means the same thing.)

FRAME 66

Open switch

Closed switch

When the switch is open, electrons (can/cannot) flow in the conductor. When it is closed, electrons (can/cannot) flow in the conductor.

Solution to Frame 65

FRAME 67

Note that the switch below is closed. Electrons can now flow through the conductor from the negative side of the battery through the _____, then through the _____ and to the _____ side of the battery.

Remember. This all happens at the same time since an electron enters the battery at the positive (+) terminal as soon as one leaves the battery at the negative (-) terminal.

Solution to Frame 66

cannot
can

FRAME 68

Inside the lamp is a wire filament that heats up and “glows” when electrons pass through it, thereby producing the _____ by which we see the dashboard instruments.

Solution to Frame 67

lamp
switch
positive

FRAME 69

You may have noticed that if a car battery gets weak (loses voltage), the dashboard light gets _____.

Solution to Frame 68

light (glow)

FRAME 70

If you have this weak battery recharged (restoring the voltage), the dim light then gets _____.

Solution to Frame 69

weak (dim, less bright, etc.)

FRAME 71

What happens is that when the voltage in the battery decreases, the number of electrons passing through the filament _____.

Solutions to Frame 70

brighter (stronger, etc.)

FRAME 72

When the voltage increases after recharging the battery, the number of electrons passing through the filament _____.

Solutions to Frame 71

decreases

FRAME 73

The relationship between voltage and current is when voltage increases, current _____.

Solution to Frame 72

increases

FRAME 74

When voltage decreases, then current _____.

Solution to Frame 73

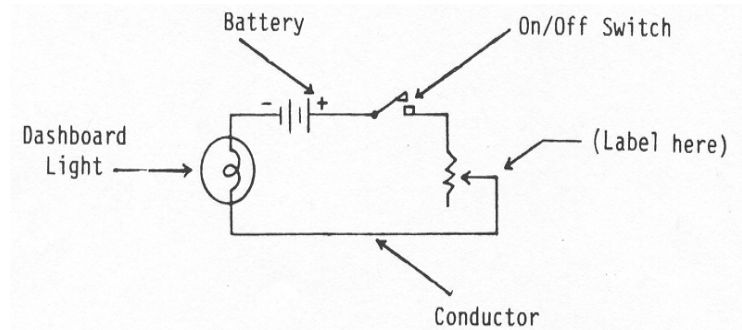

increases

FRAME 75

In most cars, you can make the dashboard light dimmer or brighter by turning a knob back and forth. What you are really turning is a variable resistor: The symbol for a variable resistor is shown below.

Label the variable resistor in the circuit below.

Solution to Frame 74

decreases

FRAME 76

A variable resistor is a device that opposes the flow of current. As its name implies, the amount of resistance that a variable resistor offers to current can be _____.

Solution to Frame 75

FRAME 77

As we increase the resistance in the circuit below, what will happen to the amount of electrons or current that can flow through the filament?

Solution to Frame 76

varied (changed, etc.)

FRAME 78

If we decrease the resistance in the circuit below, what will happen to the amount of electrons or current that can flow through the filament?

_____.

Solution to Frame 77

It will decrease (fewer electrons will pass, etc.)

FRAME 79

When you turn the variable resistor so as to decrease resistance, the dashboard light becomes

_____.

Solution for Frame 78

It will increase, etc,

FRAME 80

When you turn the variable resistor so as to increase resistance, the dashboard light becomes

_____.

Solution to Frame 79

brighter

FRAME 81

See what you can conclude about the relationship between resistance and current.

When resistance increases, then current

_____.

When resistance decreases, then current

_____.

Solution to Frame 80

dimmer

FRAME 82

Actually there are two kinds of resistors—variable and fixed. In a fixed resistor, the amount of resistance is _____.

Solution to Frame 81

decreases

increases

FRAME 83

Label each resistor below:

_____ resistor

_____ resistor

Solution to Frame 82

fixed (unchanging)

FRAME 84

Let us review some of the things we have covered:

- A material with many free electrons is called a _____.
- A material with few if any free electrons is a _____.
- The flow of electrons from atom to atom through a conductor is called _____.

fixed resistor

variable resistor

Solution to Frame 83**FRAME 85**

Review (continued)

- The force or push that makes electrons flow through a conductor is called _____.
- Voltage or electromotive force is technically defined as a _____.
- A device that opposes the flow of current is called a _____.

Solution to Frame 84

a. conductor

b. nonconductor

c. current

<p>FRAME 86</p> <p>Review (continued)</p> <p>g. As voltage is increased, the current _____.</p> <p>h. As voltage is decreased, the current _____.</p> <p>i. As resistance increases, then current _____.</p> <p>j. As resistance decreases, then current _____.</p>	<p>Solution to Frame 85</p> <p>d. voltage (or electromotive force}</p> <p>e. difference in potential</p> <p>f. resistor</p>
<p>FRAME 87</p> <p>You know how we use a unit of measurement, such as miles or feet, to measure distances. We also use a unit of measurement for current. It is the ampere. For example, a house fuse will be rated for 10 amperes, 15 amperes or perhaps, 20 _____.</p>	<p>Solution to Frame 86</p> <p>g. increases</p> <p>h. decreases</p> <p>i. decreases</p> <p>j. increases</p>
<p>FRAME 88</p> <p>The unit of measurement for current, as you have just seen, is the _____.</p>	<p>Solution to Frame 87</p> <p>amperes</p>
<p>FRAME 89</p> <p>Amperes are the unit of measurement for _____.</p>	<p>Solution to Frame 88</p> <p>ampere</p>
<p>FRAME 90</p> <p>Amperes can be abbreviated with the letters "amp." For example, house fuse of 20 amperes might be labeled 20 _____.</p>	<p>Solution to Frame 89</p> <p>current</p>

<p>FRAME 91</p> <p>The word “current” can also be abbreviated. The abbreviation for current is the capital “I.” Instead of writing “the current = 10 amperes,” you could write that _____ = 10 _____.</p>	<p>Solution to Frame 90</p> <p>amp</p>
<p>FRAME 92</p> <p>Rewrite this statement using abbreviations instead of words:</p> <p>The current is 30 amperes</p> <p>_____</p> <p>(Rewrite the statement here)</p>	<p>Solution to Frame 91</p> <p>I</p> <p>amp</p>
<p>FRAME 93</p> <p>The unit of measurement for voltage is the volt. For example, most houses are wired to have 110 _____.</p>	<p>Solution to Frame 92</p> <p>I = 30 amp</p>
<p>FRAME 94</p> <p>Instead of writing out the word “volts,” it can be abbreviated with the “v.” For example, 12 volts can also be written as _____.</p>	<p>Solution to Frame 93</p> <p>volts</p>
<p>FRAME 95</p> <p>Voltage, like volts, can also be abbreviated. The abbreviation for voltage is the capital “E.” Instead of writing that “the voltage = 10 volts,” we can also write _____ = 10 v.</p>	<p>Solution to Frame 94</p> <p>12 v</p>

<p>FRAME 96</p> <p>Rewrite this statement using abbreviations instead of words:</p> <p>The voltage = 500 volts</p> <p>_____</p> <p>(Rewrite the statement here)</p>	<p>Solution to Frame 95</p> <p>E</p>
<p>FRAME 97</p> <p>Instead of writing out “electromotive force,” we sometimes use the letters EMF. The letters EMF stand for _____.</p>	<p>Solution to Frame 96</p> <p>E = 500 v</p>
<p>FRAME 98</p> <p>Resistance is measured in ohms. For example, a resistor may be 1,000 ohms, or perhaps 50,000 _____.</p>	<p>Solution to Frame 97</p> <p>electromotive force</p>
<p>FRAME 99</p> <p>Resistance is abbreviated with the letter R, and ohms is represented with this symbol Ω.</p> <p>Rewrite this statement using the abbreviated representations.</p> <p>The resistance = 500 ohms</p> <p>_____</p>	<p>Solution to Frame 98</p> <p>ohms</p>

FRAME 100

We have gone through these symbols and units of measurement rather quickly, so why don't you practice them by completing the table a few times in the next few steps.

	Abbreviation	Unit of Measurement	Abbreviation or Symbol
Current			
Voltage			
Resistance			

Solution to Frame 99

$$R = 500 \Omega$$

FRAME 101

If you are really positive you know this, you can skip this frame. If not, practice again. DO NOT FOOL YOURSELF. YOU MUST LEARN THIS, SO WHY NOT DO IT NOW?

	Abbreviation	Unit of Measurement	Abbreviation or Symbol
Current			
Voltage			
Resistance			

Solution to Frame 100

	Abbreviation	Unit of Measurement	Abbreviation or Symbol
Current	I	ampere	amp
Voltage	E	volt	v
Resistance	R	ohm	Ω

FRAME 102

Unlike charges (attract/repel) each other.

Solution to Frame 101

	Abbreviation	Unit of Measurement	Abbreviation or Symbol
Current	I	ampere	amp
Voltage	E	volt	v
Resistance	R	ohm	Ω

FRAME 103

The movement of electrons from atom to atom through a conductor is called _____.

Solution to Frame 102

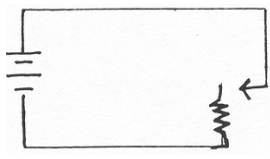

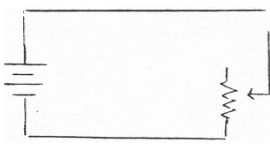

attract

FRAME 104

Matter that has many free electrons is called a _____.

Solution to Frame 103

current

<p>FRAME 105</p> <p>Matter with few or no free electrons is called an _____.</p>	<p>Solution to Frame 104</p> <p>conductor</p>
<p>FRAME 106</p> <p>The “force” or difference in potential, which makes electrons flow through a conductor, is referred as either _____ or _____.</p>	<p>Solution to Frame 105</p> <p>insulator</p>
<p>FRAME 107</p> <p>A device, which is designated to oppose the flow of current, is called a _____.</p>	<p>Solution to Frame 106</p> <p>voltage (E) electromotive force (EMF)}</p>
<p>FRAME 108</p>  <p>As resistance is decreased in the above circuit, what will happen to the current?</p> <p>_____</p>	<p>Solution to Frame 107</p> <p>resistor</p>
<p>FRAME 109</p>  <p>As resistance is increased in the above circuit, what will happen to the current?</p> <p>_____</p>	<p>Solution to Frame 108</p> <p>It will increase</p>

FRAME 110

This drawing represents a voltmeter. Voltage is measured by a _____.

Solution to Frame 109

It will increase.

FRAME 111

This drawing represents an ammeter. Current (in amperes) is measured by an _____.

Solution to Frame 110

voltmeter

FRAME 112

In this drawing of a circuit, part "X" represents a(n) _____ and part "Y" represents a(n) _____.

Solution to Frame 111

ammeter

FRAME 113

You have already learned the relationship between voltage and current in a circuit; that is, if voltage increases, current will also _____.

Solution to Frame 112

ammeter

voltmeter

FRAME 114

Suppose you have worn down your car battery. Your headlights become dim. You get the battery recharged. Your headlights become _____.

Solution to Frame 113

increase

Why? _____
_____.

FRAME 115

Suppose we replace the battery in this circuit with a 15-volt battery, the current will (increase/decrease).

Solution to Frame 114

brighter

Because you have increased the voltage which causes the current in the headlights to increase also.

FRAME 116

Remember that resistance opposes the flow of electrons (current). Therefore, if we increase the resistance in a circuit, the current will _____.

Solution to Frame 115

decrease (went from 25v to 15v)

FRAME 117

Suppose we turn the variable resistor so that it gives less resistance. The current will _____.

Solution to Frame 116

decrease

FRAME 118

Let us review the relationship between current, resistance, and voltage.

- If voltage is increased, the current _____
- If voltage is decreased, the current _____
- If resistance is increased, the current _____
- If resistance is decreased, the current _____

Solution to Frame 117

increase

<p>FRAME 119</p> <p>The relationships among current, voltage and resistance were first expressed by George Ohm. "Ohm's Law" states that the current is directly proportional to applied voltage and inversely proportional to resistance. Since this relationship was first recognized by Ohm, this principle is named after him. We call it _____ law.</p>	<p>Solution to Frame 118</p> <ul style="list-style-type: none"> a. increases b. decreases c. decreases d. increases
<p>FRAME 120</p> <p>Ohm's Law states that:</p> <ul style="list-style-type: none"> a. If voltage is increased, the current _____ . b. If voltage is decreased, the current _____ . c. If resistance is increased, the current _____ . d. If resistance is decreased, the current _____ . 	<p>Solution to Frame 119</p> <p>Ohm's</p>
<p>FRAME 121</p> <p>Ohm's law can be expressed as a formula. The basic formula is $I = E/R$ (current = voltage divided by resistance). There are other ways of writing Ohm's law, but the basic way is $I = \underline{\hspace{2cm}}$.</p>	<p>Solution to Frame 120</p> <ul style="list-style-type: none"> a. increases b. decreases c. decreases d. increases

<p>FRAME 122</p> <p>The basic formula for Ohm's law is _____.</p> <p>In this formula:</p> <p>I stands for _____</p> <p>E stands for _____</p> <p>R stands for _____</p>	<p>Solution to Frame 121</p> $\frac{E}{R}$
<p>FRAME 123</p> <p>When Ohm's Law is written $I = \frac{E}{R}$, it solves for current (I).</p> <p>When Ohm's Law is written $R = \frac{E}{I}$, it solves for resistance (R).</p> <p>Complete the following Ohm's Law formula so that it solves for voltage (E).</p> <p>E = _____</p>	<p>Solution to Frame 122</p> $I = \frac{E}{R}$ <p>current</p> <p>voltage</p> <p>resistance</p>
<p>FRAME 124</p> <p>Write the formula for Ohm's Law as you would use it to find resistance. _____</p>	<p>Solution to Frame 123</p> $E = IR$
<p>FRAME 125</p> <p>Write the formula for Ohm's Law as you would use it to find voltage _____</p>	<p>Solution to Frame 124</p> $R = \frac{E}{I}$
<p>FRAME 126</p> <p>The basic formula for Ohm's Law is _____.</p>	<p>Solution to Frame 125</p> $E = IR$

<p>FRAME 127</p> <p>Solve this problem:</p> <p>$R = \frac{E}{I}$: E = 15 volts, I = 3 amp</p> <p style="text-align: center;">R = _____</p>	<p>Solution to Frame 126</p> $I = \frac{E}{R}$
<p>FRAME 128</p> <p>Solve this problem:</p> <p>E = IR: I = 3 amp, R = 3 ohms</p> <p style="text-align: center;">E = _____</p>	<p>Solution to Frame 127</p> $R = \frac{E}{I} = \frac{15}{3}$ <p>R = 5 ohms</p>
<p>FRAME 129</p> <p>The basic formula for Ohm's law ($I = \frac{E}{R}$) expresses the basic relationship between current and voltage. That is, if the voltage is increased, the current will _____. If the voltage is decreased, the current will _____.</p>	<p>Solution to Frame 128</p> $E = IR$ $E = 3 \times 3$ $E = 9 \text{ volts}$
<p>FRAME 130</p> <p>Now let us work with some actual circuit drawings.</p>	<p>Solution to Frame 129</p> <p>increase</p> <p>decrease</p>

FRAME 131

The value of the resistor in the above circuit can be found by using the formula $R = \frac{E}{I}$. Since the value of E is 15 volts, and the value of I is 3 amps, $R = \frac{15}{3} = 5 \Omega$.

Solution to Frame 130

go on to the next step

FRAME 132

In the circuit above, the voltmeter would read 12.5.

Solution to Frame 131

$$\frac{E}{I}$$

15

3

5

Solution:

$$R = E/I = 15/3 = 5 \Omega$$

FRAME 133

In the circuit above, the ammeter would read 0.2.

Solution to Frame 132

12.5 v

Solution:

$$E = I R = 0.5 \times 25 = 12.5$$

FRAME 134

The value of the resistor in the above circuit is _____.

Solution to Frame 133

0.2 amp

Solution:

$$I = \frac{E}{R} = \frac{10}{50} = 0.2$$

FRAME 135

You have completed this text, "Basic Electricity."

If you are taking the course for credit, you should review the frames before starting the examination.

Solution to Frame 134

5 Ω

Solution:

$$R = \frac{E}{I} = \frac{20}{4} = 5$$

End of Lesson 1
